

## Juneau's 2011 Christmas Bird Count

The Juneau Christmas Bird Count for 2010 was held on December 17. We lucked out on the weather, but birding was rather quiet, with a paucity of passerines making for a rather uneventful count. Thirty field observers found 66 species and 10,973 individual birds on count day, plus an additional five species were located during the other days of our count week. All the common species that have been seen on the previous 38 counts were found once again. Highlights included a Rock Ptarmigan and Rough-legged Hawk during count week; a record count for Pacific Loons, as many birds continued to linger around the Auke Bay harbor facilities; and a new high count for Mew Gull. We also nabbed the Black-capped Chickadee that had been regularly visiting Patty Rose's feeder, and had six Lapland Longspurs on the wetlands. This species had never been found on count day before and had only been found during one prior count week, in 1997. Finally, Gus van Vliet, Molly McCafferty, and Mary McCafferty located a Hoary Redpoll on count day. This was a new species for our cumulative count list. See the table for all the results. Species in bold face are unusual or rare; numbers in bold face but not the species indicate new high counts.

As usual, the tally of birds was led by Gus after the potluck at Mark and Debi's home. The food contributions were again terrific and it was a fun way to end the day. Thanks to all who participated. The results of our count will be entered online to National Audubon in early January.

Mark Schwan

### Juneau Christmas Bird Count Results December 17, 2011

<u>Species</u>	<u>2011 Count</u>		
Canada Goose	665	Common Goldeneye	212
Gadwall	29	Barrow's Goldeneye	239
